

MaximEyes® EHI Export Documentation

Introduction

MaximEyes supports the 170.315(b)(10) Electronic Health Information (EHI) Export certification requirement and uses [HL7® FHIR® Release 4](#).

The document enables a user to export the patient's EHI data in the NDJSON format. The EHI data can be exported either for a single patient or all patients. This functionality can be performed by users having permission to perform the actions.

Data Export

The data Export feature allows data to be exported:

- For a single patient
- For all patients

Data Export for a Single Patient

- To export the EHI data for a single patient, login to MaximEyes.com and navigate to Reports-> Incentive Programs. Open the electronic health information screen.
- Users with required permissions can export the data.
- Search and select a patient to export the data for.

Schedule

Download

- Click the download button.
- The files will be downloaded in the “Downloads” folder in zipped format
- The file will be downloaded in NDJSON format. The contents of the file will include the patient’s EHI.

Sample format of the file

100062_11_08_2023_0
8_33_Patient.json

Data Export for all the Patients

User can export data for all the patients by selecting ‘All Patient’ checkbox.

Electronic Health Export(EHI)

Schedule

Download

When the data is exported, a separate file will be created for each patient and each resource. These files will be downloaded in the format mentioned here, “PatientID_Date_ResourceType”.

The application uses JWK token type for the authorization and the authorized token will be valid for 300s.

With the valid access token, the request for data export can be issued. This can be done using an HTTP GET method request with export request parameters.

GET/api/{customerName}/R4/Patient/Export

1. Parameters for Receiving the Access Token

Scope	required	the scope of access requested
grant_type	required	Fixed value: client_credentials
client_assertion_type	required	Fixed value: urn:ietf:params:oauth:client-assertion-type:jwt-bearer
client_assertion	required	Signed authentication JWT value
id_token_key_type	required	Fixed value: JWK

2. Response Format

access_token	required	The access token issued by the authorization server.
token_type	required	Fixed value: bearer.
Expires_in	required	The lifetime in seconds of the access token. The recommended value is 300, for a five-minute token lifetime
scope	required	Scope of access authorized

Query Parameters

Query Parameter	Type	Description
_since	FHIR	Allows you to export the resources that have been modified since the time provided.
_type	String of comma separated FHIR resource	Allows you to specify which types of resources will be included. For example, _type=Patient would return only patient resource

Scope of EHI

Patient Demographic
Social History
Problems
Medications
Allergies and Reactions
Diagnostic Results
Vital signs
Encounter Diagnoses
Procedures
Care team members
Immunizations
Assessment and plan of treatment
Goals
Insurance Providers
Accounts

Error Codes

Status	Description
401	Access token is invalid/expired
400	Invalid search parameter
500	Internal server error
