

170.315(b)(10) Electronic Health Information export

Overview

The certification criterion 170.315(b)(10) pertains specifically to the ability of an EHR system to support the export of Electronic Health Information (EHI). It ensures that the system can export a patient's health information in a format that can be used by other systems, which is critical for interoperability and patient data portability.

EHI export refers to the ability of users to retrieve, view, or interact with a patient's health information that is stored electronically. EHI can include medical history, test results, treatment plans, and other health-related data. Ensuring easy and secure access to this information is crucial for effective healthcare delivery and patient engagement.

inteliMD hereby attests and confirms its commitment to enhancing user access to the patient's Electronic Health Information (EHI). Our Electronic Health Record system is designed in alignment with the ONC Health IT Certification 170.315(b)(10) pertaining to EHI Export.

Purpose and Scope

EHI export feature is to provide system level user (superadmin) with the ability to export all patient's health information in a standardized format.

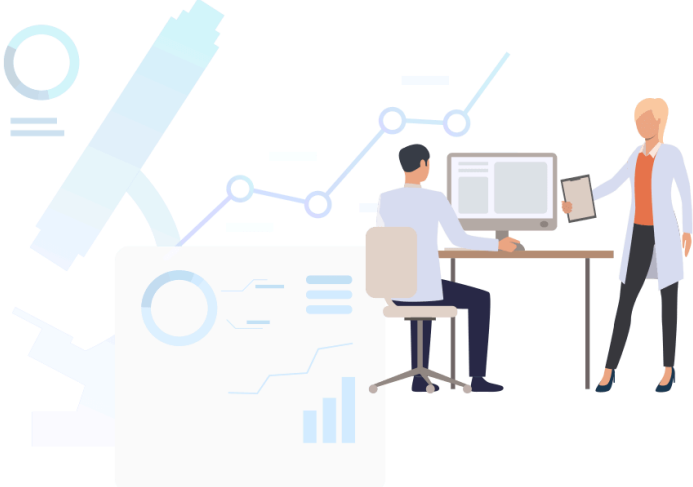

Define the scope of the export feature, including what data types (e.g. demographics, clinical notes, medications, lab results etc) will be included.

Specify whether the feature applies to individual patient exports or bulk exports for a population of patients.

Single Patient's export data from UI

Please log in to the intelIMD portal using your Superadmin credentials. Once logged in, proceed to verify the One-Time Password (OTP) that has been sent to your registered mobile number.

Navigate to the Patient List page within the inteliMD portal. Once there, review the list of patients displayed. Identify and select the specific patient whose Electronic Health Information (EHI) you intend to export. Ensure that you choose the correct patient by verifying details such as the patient's name, date of birth, and any other relevant identifiers before proceeding with the data export process. Under the Action column, click the eye icon. The popup will show the patient EHI view have two buttons download PDF and C-CDA

Click to **PDF** and **C-CDA** to export the single patient EHI data.

Bulk Export of All Patients Individual Data

For bulk export of patient records, click on the 'Download Records' button. This action will initiate the generation of a C-CDA XML file containing the selected patients. You will notice a countdown timer indicating the time remaining for the file generation process. Once the countdown is complete, the bulk export C-CDA XML files will be automatically downloaded to your system in .zip file format. Please wait patiently during this process, as the time required may vary depending on the size and complexity of the data being exported.

Initiate the Bulk Export:

Begin by clicking on the 'Download Records' button. This action sends a request to the server, instructing it to compile and generate a comprehensive C-CDA XML file that includes the records of all patients in the system. The server then processes this request, gathering and formatting the data accordingly.

Countdown and Automatic Download:

After the request is submitted, you will receive a message on the screen that includes a countdown timer. This timer indicates the estimated time remaining for the server to complete the generation of the C-CDA XML file. Please monitor the countdown, as it provides a visual cue for the progress of the file creation. Once the countdown reaches zero, the server finalizes the C-CDA XML file, which will then automatically be downloaded to your system. You won't need to take any further action, as the download process will start on its own upon completion.

Patient EHI C-CDA XML

The exported C-CDA XML file contains the Electronic Health Information (EHI) for all selected patients. This file includes comprehensive health data such as medical history, test results, treatment plans, and other relevant health records. Each patient's information is organized and presented in a structured format within the C-CDA XML, allowing for easy access and review. The exported document ensures that all pertinent patient data is accurately compiled and available for further use or analysis.

Error Codes

Status	Description
400	Invalid search parameter
500	Internal Server Error
401	Unauthorized access
