Introduction

The purpose of this document is to provide end-users with the ability to understand the process of how data within our system is exported as well as the resulting file types. This function meets the requirements of the Electronic Health Information export criterion §170.315(b)(10) in the ONC Health IT Certification.

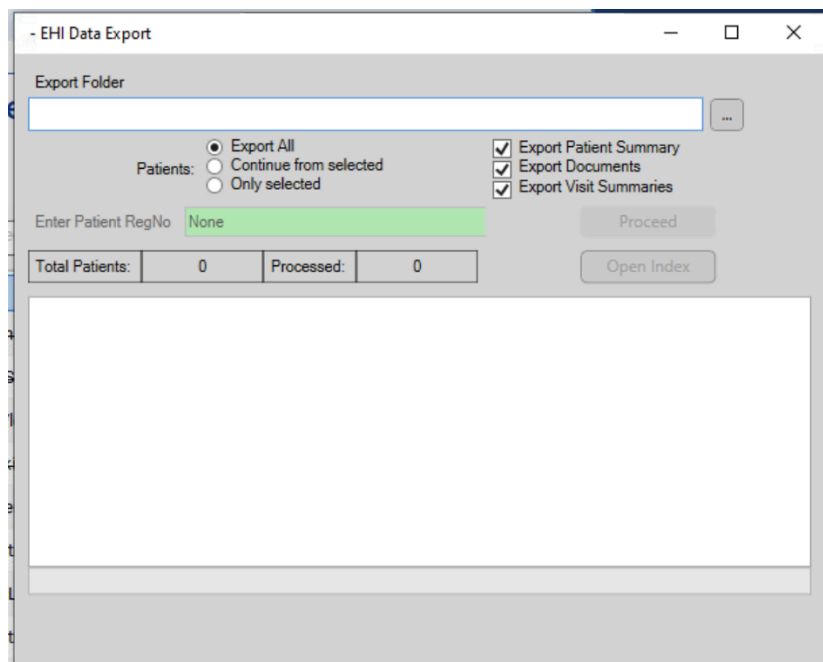

Praxis Data Export Utility

The data export utility is designed so that a complete data export for one or several patients can be conducted from the Praxis Control Panel. Access is gained by pressing the corresponding button on the right tab of the Control Panel:

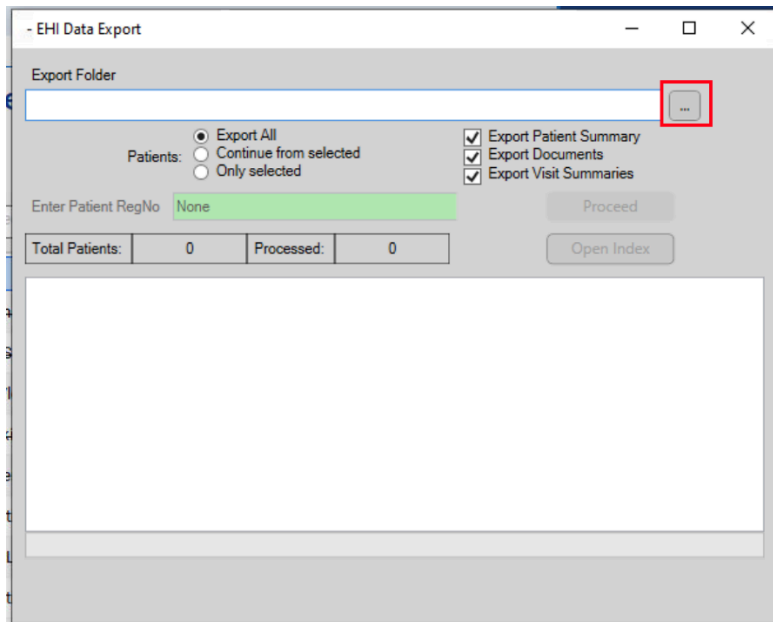

Selecting the Patients to Export

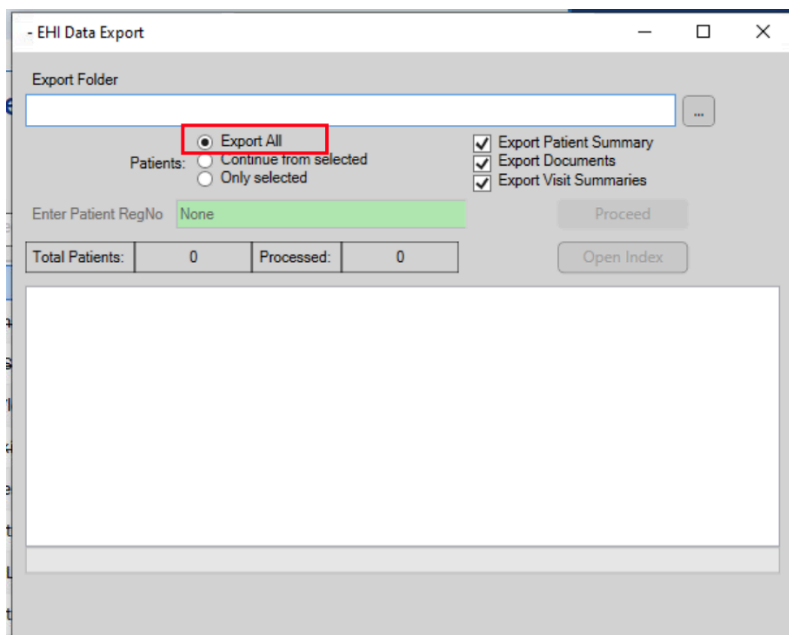

It will then display the main screen of the utility:

The first thing to define is the folder where the exported information will be placed, which is done by using the corresponding button:

The next step is to indicate which patients you intend to export. By default, the application has the 'Export All' option selected and has the Patient Chart Number option set to 'None' (see explanation of this below):

If you select the option 'Continue from selected' (indicated by 1 in the image below) or the option 'Only Selected' (indicated by 2), the entry of the Patient Chart Number is enabled (indicated by 3):

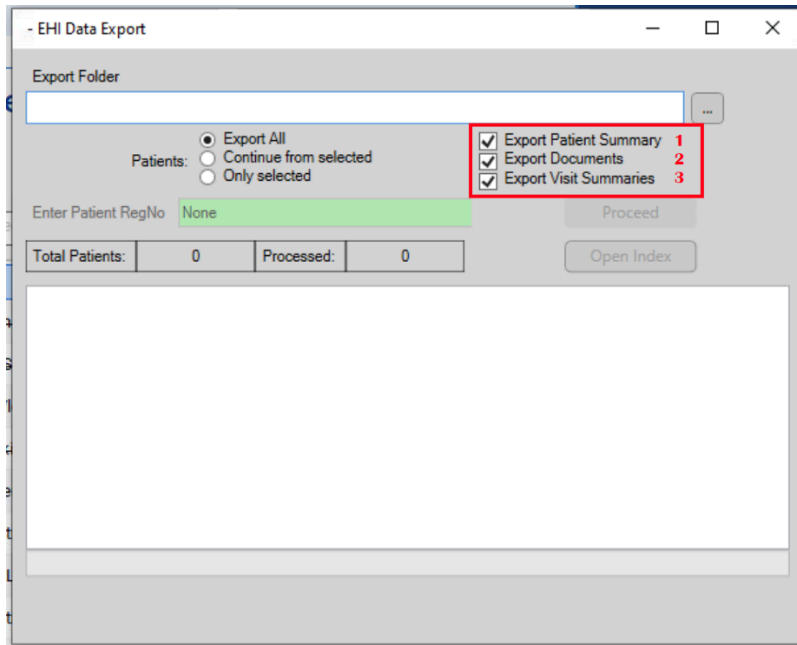

The screenshot shows the 'EHI Data Export' window. In the 'Patients' section, three radio buttons are present: 'Export All', 'Continue from selected' (marked with a red '1'), and 'Only selected' (marked with a red '2'). The 'Continue from selected' option is selected. Below this, the 'Enter Patient RegNo' field is highlighted in green and contains the text 'ABRCA000' (marked with a red '3'). To the right, there are three checked checkboxes: 'Export Patient Summary', 'Export Documents', and 'Export Visit Summaries'. At the bottom, there are buttons for 'Proceed' and 'Open Index', and a status bar showing 'Total Patients: 0' and 'Processed: 0'.

"The 'Continue from selected' option indicates the desire to continue exporting, starting with the patient whose chart number was entered in (3). This is very useful for stopping the operation and resuming it later from that patient, or in some cases, if the export is interrupted for any reason, to continue from where it was interrupted.

The 'Only Selected' option indicates that only the information of that specific patient is to be exported."

Selecting the Documents to Export

The next step is to define what information will be exported for each patient:

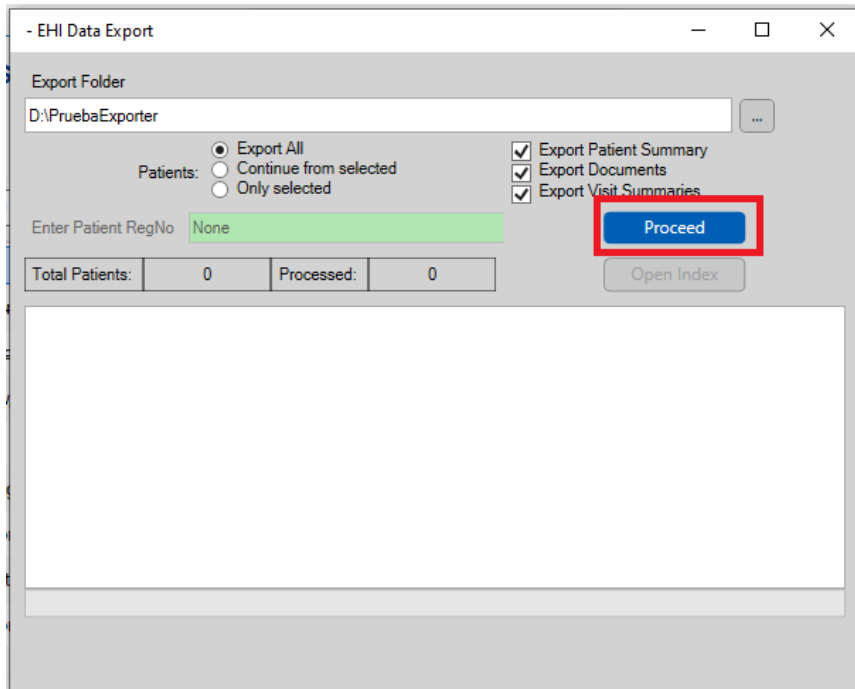

The screenshot shows the 'EHI Data Export' window. It has a title bar with standard window controls. Below the title bar is an 'Export Folder' text box with a browse button. Underneath is a 'Patients' section with three radio buttons: 'Export All' (selected), 'Continue from selected', and 'Only selected'. To the right of these is a red-bordered box containing three checked checkboxes: 'Export Patient Summary' with a red '1' to its right, 'Export Documents' with a red '2' to its right, and 'Export Visit Summaries' with a red '3' to its right. Below this is an 'Enter Patient RegNo' field with 'None' entered. At the bottom left are 'Total Patients: 0' and 'Processed: 0' fields. At the bottom right are 'Proceed' and 'Open Index' buttons.

1. **"Export Patient Summary"** indicates that the complete patient summary should be exported in CDA format (suitable for importing into another EMR compliant with the standard certified by ONC) and its corresponding human-readable file in HTML format.
2. **"Export Documents"** indicates that all patient documentation should be exported, which includes:
 - a. Text from all visits.
 - b. Text from all inserted notes.
 - c. Attachments from all inserted notes in their original format (PDF, XLSX, PNG, etc.).
3. **"Export Visit Summaries"** indicates that a summary in CDA format should be exported for each visit (suitable for importing and reconciling with any other EMR compliant with the standard certified by ONC) and its corresponding human-readable file in HTML format.

Finalizing the Export

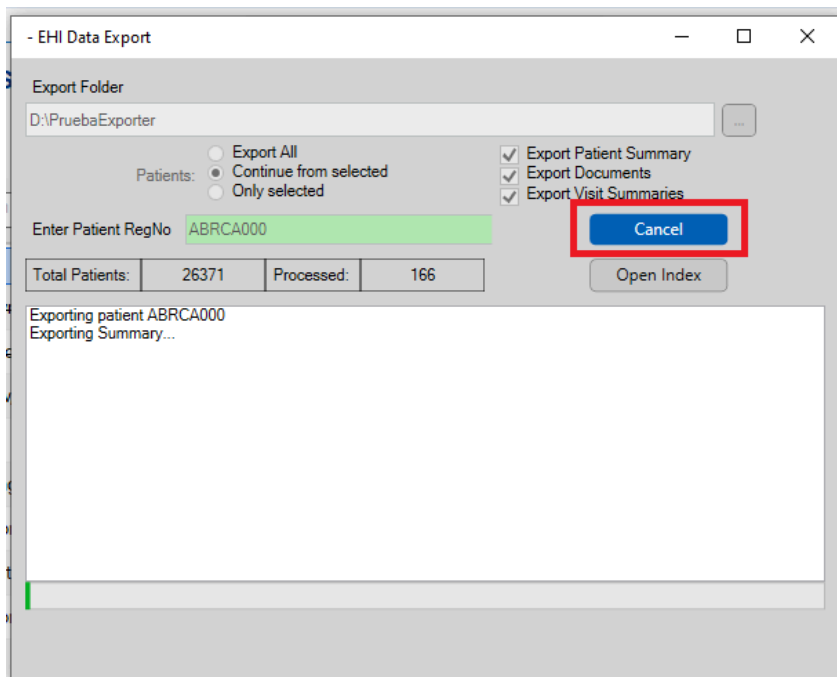

Once the previous steps are completed, the Proceed button will become enabled.

The screenshot shows the "EHI Data Export" dialog box. The "Export Folder" is set to "D:\PruebaExporter". Under "Patients", the "Export All" radio button is selected. To the right, three checkboxes are checked: "Export Patient Summary", "Export Documents", and "Export Visit Summaries". The "Enter Patient RegNo" field contains "None". A blue "Proceed" button is highlighted with a red rectangle. Below the input fields, a table shows "Total Patients: 0" and "Processed: 0". An "Open Index" button is also visible.

Total Patients:	0	Processed:	0
-----------------	---	------------	---

If you press Proceed, the button will change its text to Cancel, and the utility will start exporting the data, patient by patient. It will update the green text box for the Patient Chart Number for each one, and in the space below, you will be able to see the total patients found, the total patients processed, and the status of the export for the current patient. Pressing Cancel during the operation will finalize the export for the current patient and stop the application.

The screenshot shows the "EHI Data Export" dialog box during the export process. The "Export Folder" remains "D:\PruebaExporter". The "Continue from selected" radio button is now selected. The "Enter Patient RegNo" field now contains "ABRCA000". The blue button, now labeled "Cancel", is highlighted with a red rectangle. The table below shows "Total Patients: 26371" and "Processed: 166". The bottom section displays the status "Exporting patient ABRCA000" and "Exporting Summary...".

Total Patients:	26371	Processed:	166
-----------------	-------	------------	-----

File Index

Once the export begins, the Open Index button will become enabled. This button allows opening an HTML page (index.html) in the default web browser. This page serves as an index of all the exported patients, displaying their name, patient chart number, date of birth, date of death (if applicable), status (Active/Inactive), gender, SSN, last attending physician, primary physician, referring physician, and all corresponding demographic information (address, phone numbers, etc).

IBFI000				02/11/1949	01/01/0001	Active	Female					

In each line, the patient's last name is a link to the folder containing all their information. The exported information goes to the folder specified in the first step. In that location, the index.html file is saved, and in the case of any export error, a log file is generated for each error.

Furthermore, a folder is created for each patient, named in the following format:

LASTNAME_[LASTNAME]_[MIDDLENAME]_FIRSTNAME_GENDER_(REG_NO)_MM-DD-YYYY

Where the date is the patient's date of birth, and the information within square brackets may or may not be present, depending on how the patient's data was entered. The link in the patient's last name in the index.html file leads to this folder.

CDA Files

Within each patient's folder, a "CDA Files" folder is generated, in which the summaries are saved in CDA format (for the patient and, if selected, for each visit).

The format of the files is as follows:

- Patient Summary - these files come in xml and a human-readable html format with the following naming convention:

LASTNAME_[MIDDLENAME]_FIRSTNAME_GENDER(REG_NO)_MM-DD-YYYY_PatientSummary.xml

LASTNAME_[MIDDLENAME]_FIRSTNAME_GENDER(REG_NO)_MM-DD-YYYY_PatientSummary.xml.html

- Visit Summary - this does not include inserted notes. It come in xml and a human-readable html format and has the following naming convention:

YYYY-MM-DD-HH-MM_VISIT_TITLE_VisitSummary.xml

YYYY-MM-DD-HH-MM_VISIT_TITLE_VisitSummary.xml.html

Doc Files and Images

In each patient's folder:

A .doc file is saved for each visit, containing all the text from that visit (including the separately printed texts). The file naming follows the format:

YYYY-MM-DD-HH-MM_VISIT_TITLE_Visit.doc, where the 'YYYY-MM-DD-HH-MM' is the date and time of the visit.

There are also .doc files containing the text of each inserted note with the following format:

YYYY-MM-DD-HH-MM_INSERTED_NOTE_TITLE_InsertedNote.doc

Each file attached to each inserted note is saved with the same name plus _fileX (where X is a sequential number) and the appropriate extension (xlsx, pdf, png, etc.):

YYYY-MM-DD-HH-MM_INSERTED_NOTE_TITLE_InsertedNote_file0.png

YYYY-MM-DD-HH-MM_INSERTED_NOTE_TITLE_InsertedNote_file1.pdf

Contact Information

For any questions about the contents of the data itself, please reach out to the data owner or originating office. For any developer related questions regarding the Praxis Data Export Utility please contact:
